Professional Summary

Analytics Engineer with 3+ years bridging data engineering and business intelligence at a B2B SaaS startup. At TollGuru, designed dimensional data models, built dbt transformation pipelines, and delivered analytics products serving enterprise fleet clients including Lyft and FirstFleet across 29 European markets. Core stack: SQL, Python, dbt Core, PostgreSQL, Looker Studio, and AWS. Focused on data modeling (star schema, Type 2 SCD), data quality frameworks, and translating complex business requirements into clean, well-tested, analysis-ready datasets. Key wins: 89% to 96% data accuracy, 45% query latency reduction, 4 production dashboards with documented lineage.

Technical Skills

Core: SQL (Window Functions, CTEs, Subqueries, Query Plan Analysis, Indexing), Python (Pandas, NumPy), dbt Core
Data Modeling: Dimensional Modeling, Star Schema, Type 2 SCD, Data Lineage, Data Quality Testing, Data Governance, Data Observability
Cloud & Infra: AWS (S3, Lambda, Glue, Athena, CloudWatch), Docker, Git, CI/CD, Medallion Architecture, Parquet
BI & Analytics: Google Looker Studio, Power BI (DAX), Supabase, Streamlit, Apache Airflow
Other: LLM API Integration, Prompt Engineering, REST APIs, Web Scraping, Cross-functional Collaboration, Agile/Scrum

Professional Experience

MapUp Inc. (TollGuru) – B2B SaaS Startup **Oct 2021 – Jul 2025**
Analytics Engineer – Europe Region *California, USA (Remote)*

- Designed star schema data models for toll pricing and routing datasets across 29 European countries, enabling standardized analytical queries and consistent metric definitions for enterprise clients including Lyft and FirstFleet.
- Built automated data quality framework (schema validation, anomaly detection, null checks) improving dataset accuracy from 89% to 96% and reducing manual review by 60% across 500+ data sources – establishing the team's first data governance standards.
- Rewrote and optimized 50+ complex SQL queries involving multi-table JOINs, window functions (ROW_NUMBER, RANK, LAG/LEAD), and CTEs; applied EXPLAIN ANALYZE and indexing to cut execution time by 45%.
- Engineered 15+ Python-based ETL/ELT pipelines automating data ingestion from 500+ government portals and REST APIs, ensuring near real-time data availability for downstream analytics.
- Architected a distance-based tolling calculation model improving pricing accuracy by 40%, directly contributing to acquisition of 3 new enterprise clients.
- Led and mentored a 5-person cross-functional team; collaborated with product, engineering, and operations stakeholders to translate business requirements into data deliverables and Looker Studio dashboards.

Projects

Enterprise Revenue Intelligence Platform **PostgreSQL, dbt Core, Python, LLM API, Looker Studio | 2026**

- Finance team lacked unified revenue visibility – designed a production-grade data warehouse on 541K transactions using star schema (3 fact + 5 dimension tables, Type 2 SCD) with a 7-model dbt pipeline, full test coverage, CI-ready config, and documented lineage.
- Built LLM-powered natural-language query interface on Supabase PostgreSQL; delivered revenue leakage detection (price anomalies, AR aging, churn exposure) and 3-method forecasting across 4 live Looker Studio dashboards.

Serverless Weather Data Platform **Python, AWS Lambda, S3, Glue, Athena, CloudWatch | 2026**

- Needed cost-effective continuous ingestion with quality guarantees – deployed Bronze-Silver-Gold medallion architecture on AWS serverless with real-time schema drift and anomaly monitoring. Result: 99%+ reliability at under $2/month.

Education

B.Tech in Computer Science Engineering **2016 – 2020**
KIIT College of Engineering *Gurgaon, Haryana*

Certifications

Google Data Analytics Professional Certificate | Coursera, 2024
Prompt Engineering for Developers | DeepLearning.AI, 2024
